

Green Onion (Scallions)

CULTIVARS

- Parade
- Deep Purple

INTENSIVE SPACING

- 5 rows (6" - 15 cm), spaced every 6" (15cm) on the row

FERTILIZATION

- Green onions will do great in beds that were previously amended with compost and fertilized with a mix of alfalfa meal (2-0-2) and pelleted chicken manure (5-3-2).

IMPLANTATION

Green onions are one of the most reliable crops. Easy to grow, consistently popular and they generate a good revenue per bed planted. We plant some every 2 weeks to ensure a constant supply throughout the season. For every seeding, we plan enough beds for an estimated 3 weeks of supply.

In our planting program, green onions are grouped with crops like lettuce, rapini, bok choy, mini-romaine, mini-fennel, dill, cilantro and mini-kohlrabi - all crops that stay in the fields +/- 50 days and that have similar crop requirements.

EQUIPMENT

- Rotary harrow
- 30" bed prep rake
- Popping tray and marking roller

ITINERARY

- Remove tarp and clean out large debris. Use the rake if needed. *
- Uniformly apply amendments and pass with the rotary harrow at a depth of 2" (5 cm). To make transplanting easier (seeing as the soil is loose after being harrowed), we only prepare the beds when we are about to transplant.
- Pass with the dibbler-roller to mark the planting holes and bring out the well-watered trays.
- Once the beds are ready, 1 person will drop the seedlings while 2 others will transplants the plants as fast as possible making that at least 3-4 onions are drop (if not, combine plugs). 3 people/ 100'bed is good ratio for efficient workflow.
- Install irrigation and water until the soil is deeply moistened.

* If the previous crop is too well established, or if the bed is too messy, mow the crop as low as possible and harrow at a depth of 2" (5 cm). Add 1" (2.5cm) of compost evenly spread on the whole width of the bed and transplant into compost following a no-till strategy.

WEEDING

- 10-14 days after transplanting, use the bio disc to cultivate on the row and between the rows in one single pass.

PLANT PROTECTION

- No action is required

HARVEST

- Green onions are harvested with their tops and bunched in the fields in a kneeled position.
- Onions are picked when they sized up between 3-4" (10-12 cm). Bottoms should be white, without any dead leaves - make sure to strip off any leaves that are crushed, or have signs of thrip damage.

- Make bunches of +/- 9 onions by grabbing 2 clumps and tying them with a rubber band. Shake off excess soil and make piles of 10 bunches in the aisles.
- 1 person should harvest at least 60 bunches/hour

CONDITIONING

- Green onions are washed using a pressure gun. Upon arriving from the fields, the bins are transferred to the cart and placed to the left of the sinks.
- A lot of bunches are placed side by side with the roots facing the operator. The operator then sprays the soil off with the gun. Turn the bunches over and repeat. Then pile to the right.
- Once the pile has reached a certain height, put in storage bin and identify the bin.
- 1 person should package at least 100 bunches per hour.

STORING

- Green onions are stored in cold room kept at 35°F (2°C)
